                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to a method of designing a ligand binding to a target molecule. The method involves identifying as molecular scaffolds compounds binding to members of a molecular family, detecting orientation of scaffolds at a binding site of target, and synthesising ligand. The invention is useful for designing drug products and for designing ligand binding to target molecules such as nuclear hormone receptors, TNF receptors, G-protein coupled receptors, methyl transferases, ligases, etc. The present sequence is the human PIM 1 protein. This sequence is used to illustrate the method of invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          16-SEP-2002;

                                                                                                                                             The invention relates to a method of screening a prophylactic-therapeutic agent for an apoptosis inducing agent or an enhancer of an anticancer agent. The method involves the use of a serine/threonine kinase Pim-1, its partial peptide or its salt. Also disclosed is a kit for carrying out the method of the invention. The method is useful for screening a prophylactic-therapeutic agent for cancer. The method is also useful for prophylaxis and/or treatment of cancer, inducing apoptosis, treating a patient having a solid tumour that is resistant to an anticancer agent (induced by hypoxia), and for screening a substance that promotes or inhibits the activity of serine/threonine kinase Pim-1. The present reguence represents a human polypeptide relating to the present
                                                                           Sequence 313
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Screening for a prophylactic-therapeutic apoptosis inducing agent or enhancer of anticancer agent, comprises use of serine/threonine kinase Pim-1, its partial peptide or its salt.

```
Crystal useful for developing Pim-1 (oncogene-encoded serine/threonine kinase) inhibitors, comprises human Pim-1 protein, Pim-1 homologue, human Pim-1 protein complex, or Pim-1 homologue complex.
```

8 SEQ ID NO 2; 219pp; English.

The invention relates to a novel crystal comprising a human Pim-1 (Oncogene-encoded serine/threonine kinase) protein, a Pim-1 homologue, human Pim-1 protein complex or a Pim-1 homologue complex. Pim-1 is primarily expressed in haemopoietic and germ cell lines and this expression is tightly regulated and induced by cytokines, mitogens and hormones. Human Pim-1 is associated with multiple cellular functions, such as proliferation, differentiation, apoptosis and tumourigenesis. To crystal of the invention relates particularly to the residues involved the active site and binding sites of Pim-1. Such information may be useful for developing Pim-1 inhibitors that are useful as therapeutic agents in the treatment of cancer. The current sequence is that of the human Pim-1 (oncogene-encoded serine/threonine kinase) protein of the The in œ

The method is useful to assess the prognosis of a cancerous disease other than ovarian cancer. It is useful to identify cancerous cells and to determine the ability of a subject to respond to a particular therapy encodes the basis of rational therapy. The present sequence is the TTK
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      21-FEB-2001;

                                                                                                                                                                                                                                                                                                            The invention relates to human HX2004-6 protein and a seven transmembrane receptor protein referred as VSHK-1 useful for diagnosing or treating cancer. The invention also relates to a method for reducing the growth of a cancerous cell. VSHK-1 is useful for identifying a VSHK-1 receptor ligand and to identify a substance which modulates its signal transduction activity. The HX2004-6 DNA is useful to detect the presence of HX2004-6 in a biological sample (e.g. ductal epithelial cells from tissue chosen from pancreas, colon and breast). The invention is useful for screening drugs for the treatment of cancer. The present sequence is the human Piml protein. This sequence is differentially expressed in

                                                                                                                                                                                                                                                                                      The invention relates to a novel method for identifying substances that regulate urinary incontinence and the urge to urinate. The method comprises incubating a test compound with a cell and/or cell preparation that has synthesized a specific protein of the PIM (proviral integration site) kinase family and measuring either binding of the test compound to the PIM kinase, or a functional parameter that is altered by the binding. The method of the invention demonstrates uropathic and gene therapy applications and may be useful for treatment and diagnosis of urinary incontinence and the urge to urinate. The method is based upon regulating the activity or expression of PIM kinases that are involved in bladder control. The current sequence is that of the human PIM-1 serine-threonine
                                                                                                                                                                                                                                             Sequence 313 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Identifying substances that regulate PIM kinases, useful for treatment and diagnosis of urinary incontinence and the urge to urinate, and similar use of PIM proteins or nucleic acids.

## **Protein Sequence Searches - February 2005**

All of the sequence databases on ABSS have recently been updated.

- Please note that the curators of the UniProt database have purged some temporary accession numbers from the most recent version of UniProt. These sequences have been assigned new permanent accession numbers. The new UniProt record may not contain the previous temporary accession number.
- If you encounter an accession number from an older search run against UniProt (results file extension .rup) that can no longer be found in the database, the permanent record with the new accession number can be found by searching the old accession number in the UniProt Protein. Archive database (UniPARC) at:

http://www.pir.uniprot.org/database/archive.shtml

If you have any questions regarding this information or your results, please contact any STIC searcher.

When submitting sequence search results for scanning into IFW, please include a copy of this attachment to assist any future Examiners or members of the public who may encounter UniProt temporary accession numbers.

-!- CATALYTIC ACTIVITY: ATP + a protein = ADP + a phosphoprotein.
-!- SUBCELLULAR LOCATION: Cytoplasmic and nuclear (By similarity).
-!- SUBCELLULAR LOCATION: Cytoplasmic and nuclear (By similarity).
-!- SIMCELLULAR LOCATION: Cytoplasmic and nuclear (By similarity).
-!- SIMILARITY: Belongs to the Ser/Thr protein kinase family. PIM

DISEASE: Frequently activated by provirus insertion in mur
leukemia virus-induced T-cell lymphomas.
SIMILARITY: Belongs to the Ser/Thr protein kinase family.
                                                                                                                                                                                                                                                                                                                            301

INDUCTION: By membrane depolarization or forskolin.
PTM: Autophosphorylated.
SIMILARITY: Belongs to the Ser/Thr protein kinase f
subfamily.

"Identification of the autophosphorylation sites of the Xenopu "Identification of the autophosphorylation sites of the Xenopu Pim-1 proto-oncogene-encoded protein kinase.";
J. Biol. Chem. 272:10514-10521(1997).
-!- CATALYTIC ACTIVITY: ATP + a protein = ADP + a phosphoprote
-!- PTM: Autophosphorylated.
-!- STMILARITY: Belongs to the Ser/Thr protein kinase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               NUCLEOTIDE SEQUENCE, AND PHOSPHORYLATION SITES.
